

Optional Feature

Compasys Release Accounting for Epicor™

Over the past several years, automotive and other similar industries have invested heavily in integrated supply chain management systems (SCM). These systems have placed a heavy burden on small and mid-sized manufacturers. Compasys Release Accounting is designed to help users of Epicor™ Manufacturing and Distribution ERP solutions meet requirements imposed by their larger customers and at the same time gain the benefits of integrated SCM in their own operations.

The Epicor™ Advanced EDI and Demand Management modules have many strong features. However, some users need more sophisticated logic in the processing of incoming forecasts and shipping schedules from their customers. Compasys Release Accounting automatically updates multiple release sales orders in Epicor™ from incoming 830 or 862 EDI transactions. The interface looks at cumulative shipments on each blanket sales order to accurately match release dates and quantities in the incoming EDI data to the existing sales order releases in Epicor.™ A detailed log is maintained to inform the user of any situations where a proper update could not be made.

For companies with a large volume of incoming EDI releases, this automation can result in huge cost savings and dramatically improved customer service for their largest customers.
